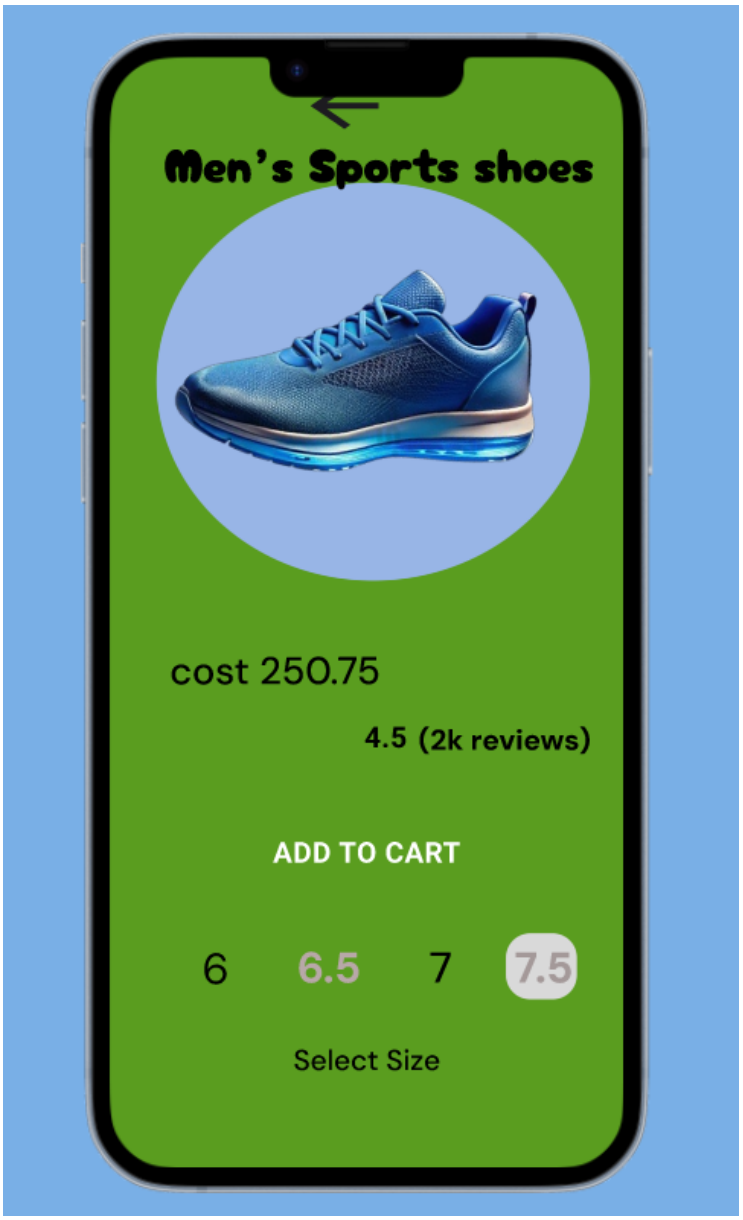
Experiment 1: Good UI vs Bad UI Design

Bad UI



Why it is Bad UI:

• Poor color choice and low contrast make text harder to read.

• Layout alignment and spacing are inconsistent, creating a messy look.

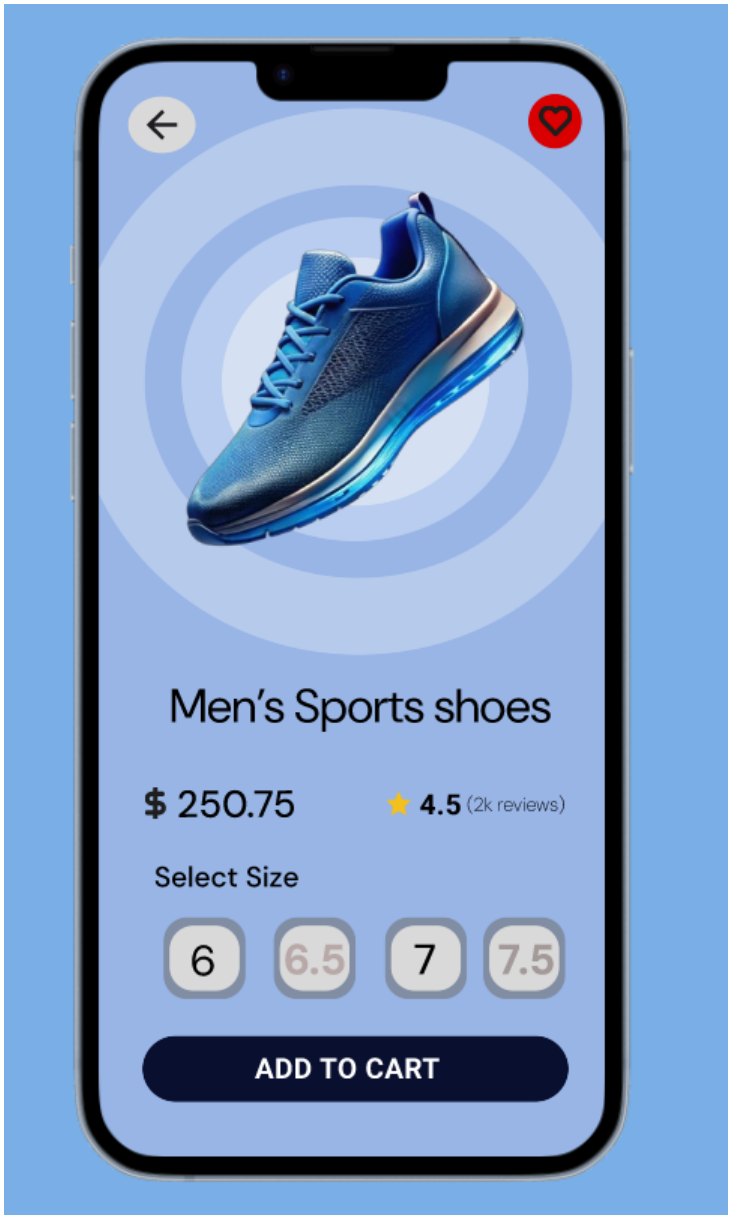
• Visual hierarchy is weak, so important information does not stand out.

• The Add to Cart button is not prominent enough.

• Typography feels inconsistent and less professional.

• Size selection is unclear, which can confuse users.

Good UI



Why it is Good UI:

• Good color contrast improves readability and comfort.

• Clean alignment and spacing create a balanced layout.

• Clear visual hierarchy guides user attention naturally.

• The Add to Cart button is bold and easy to notice.

• Consistent typography gives a professional appearance.

• Size options are clearly shown and easy to select.

Result

The good UI design follows key UI/UX principles such as proper contrast, alignment, visual hierarchy, and consistency, making it easier to use and understand. The bad UI design lacks these principles, which reduces readability and creates user confusion.
